

INTRODUCTION¹

- Type 2 Diabetes affects over 35.4 million people in American each year, and 1/3 adults with prediabetes are unaware they suffer from the health condition.²
- Lifestyle changes taught in the Diabetes Prevention Program (DPP) such as increasing physical activity and maintaining a healthy weight have been proven to lower a person' risk for developing Type 2 Diabetes.³
- In a 10 year follow up study completed by the CDC, they found that compared to people who did not complete the program, those who completed the DPP in its entirety were 1/3 less likely to develop Type 2 Diabetes.³
- However, many people who begin the 12-month DPP do not complete it in its entirety. 4
- Existing literature shows that barriers to retention include lack of connection with th lifestyle coaches, transportation, childcare and work conflicts.⁵
- The purpose of this project is to discover possible barriers that hinder participants from fully engaging and completing the DPP. With this knowledge we can improve future cohorts and increase participant retention.

- This project was deemed as a quality improvement by the UMCIRB and did not need further IRB approval
- Participants for the project were identified from an existing list of all DPP patients at ECU Family Medicine. This list was further narrowed by excluding deceased patients and patients with 100% noted attendance.
- Interview guide consisted of questions related to barriers and facilitators of participant attendance, adherence, and overall experience.
- On average each interview lasted approximately 12 minutes. The shortest interview was 56 seconds, and the longest interview was 36 minutes and 9 seconds.
- Based on interview guide questions and any data there were newly emergent from transcripts, a consensus codebook was created.
- Coders independently coded 21 transcripts.
- Code reports and frequency tables were used to determine major themes and subthemes.

PARTICIPANT DEMOGRAPHICS

- Participant demographics are in Table 1 below.
- A majority of participants in the project identified as Non-Hispanic Black, were 60-79 years of age, and female.
- Major themes, subthemes, and corresponding quotes appear in Table 2. Themes and subthemes revolved around the larger concepts of enrollment, motivation to join, positive experiences, and barriers to attendance.

	Total DPP Patient Population (n = 133)		Project Sample Population (n = 21)	
Characteristic	Number	Percentage	Number	Percentage

DISCUSSION

• Participant demographic information demonstrates that 98.5% of the population are 18-79 years of age, which means many participants are still in the workforce. Weekly, hour-long classes in the middle of the workday, for a year, are not feasible commitments for everyone who does not have accommodating work environments.

Some participants noted having personal health issues that hindered their attendance. It is important to still promote the option of online learning for attendance, check in on participants to see if positive health status has returned to continue to matriculate through DPP, and allow participants with serious health hindering diseases to withdraw and be able to rejoin another

 Some participants stated that the one-year commitment is needed for program success, but still is not an achievable commitment for them due to personal commitment issues.

• Some participants with young children stated that being unable to get a babysitter, having a sick child at home for the day, and school pick-up up times hindered them from full program

• Limitations of this analysis include limited participant recall of experience as program enrollment dates up to 5 years ago, and 48% of non-completers completed an interview.

CONCLUSION

Notable barriers to DPP attendance include:

Person Health Problems/Caregiving for Family Members

• Ask previous participants to come back and give <u>Success Stories</u>

Offer ECUP RDNs, LDNs, CDCES, MDs, and Endocrinologists as Guest Speakers Provide Grocery Giveaways to jumpstart a participant's ability to make the

Provide Exercise Classes for physical activity discussions

Match program participants with one another from Day 1 to increase Accountability These suggested modifications will be reviewed and implemented into future DPP cohorts if feasible. ECUP may not be able to successfully meet CDC mandates for the DPP program and may need to explore other Health Service Organization (HSO) programming initiatives for pre-diabetes and other chronic disease prevention.
